```

1.: After completing the installation and full update of Ubuntu 21.04 DT edition. Installed Apache2.

2.: Created rules for Apache2 on the FW.

3.: Testing service status locally an through web browser from host PC.

The screenshot shows a host PC desktop with a Ubuntu background. A web browser window is open, displaying the Apache2 Ubuntu Default Page. The browser's address bar shows the URL 192.168.136.128. The page content includes the Ubuntu logo, the text "Apache2 Ubuntu Default Page", and a red banner that says "It works!". Below this, there is a paragraph explaining that the page is the default welcome page used to test the correct operation of the Apache2 server. A "Configuration Overview" section follows, detailing the configuration files and documentation. At the bottom of the page, a code block shows the configuration layout for an Apache2 web server installation on Ubuntu systems.

```
/etc/apache2/  
|-- apache2.conf  
    |-- ports.conf  
    |-- mods-enabled  
        |-- *.load  
        |-- *.conf
```

Two terminal windows are also open. The top terminal window shows the output of the `ifconfig` command, displaying network configuration details for the `ens33` and `lo` interfaces. The bottom terminal window shows the output of the `systemctl status apache2.service` command, indicating that the Apache HTTP Server is loaded and active (running).

```
